PULP AND PAPER ACCOUNT

GASKET DESIGN Selco Seal Ring Gasket

APPLICATION Steam Dryer on a Bagley and Sewall dryer Kruger Canada

The customer needed to deal with constant leakage from the paper machines dryer head. This constant leaking was costing money in shutdowns and the gaskets they were using rarely lasted four weeks before it became necessary to replace them. This continual need to deal with this problem meant the shutdown of an entire line at the paper mill whilst the gasket was being replaced.

The Selco Seal Ring Gasket was installed with a bolt seal Fin Fan.

RESULTS With the Selco Seal the continuous run time went from a maximum of 4 weeks to months then well over a year and continues to perform.
The overall energy costs were dramatically reduced with the application of this total solution.

The ROI is difficult to calculate but the customer feels that the biggest impact is on the profitability of the plant. With this Gasket they have been able to continuously have all four machines operating at the same time. The savings in labor whilst substantial are small in comparison and the customer is very happy with the results.
